

Funding Proposal for Secure IT Infrastructure

A scalable technology foundation for growth, data protection and business continuity.

Cape Town • 25 employees • Growth-stage technology startup

Investment focus

Secure network • Endpoint devices • Backups •
Cybersecurity • IT support readiness

Who We Are

A Cape Town technology startup entering a growth phase

25

Employees

5

Departments

New

Office move

Scale

Priority

Business profile

Ubuntu Innovations is a South African technology startup based in Cape Town. The company is relocating to a new office and needs reliable infrastructure that supports secure daily operations and future growth.

Employee breakdown

Investor message

Ubuntu Innovations is not requesting technology for convenience. The company requires a stable digital foundation to protect operations, staff productivity and future client trust.

The Business Problem

Growth creates risk when systems are informal, unsecured or difficult to manage

Operational risk
Unreliable connectivity and unmanaged devices can slow work, interrupt communication and reduce team productivity.

Data risk
Finance, HR and development information must be protected from unauthorised access and accidental exposure.

Continuity risk
Without backups and recovery planning, hardware failure or cyber incidents could stop operations.

Security risk
Phishing, weak passwords, malware and ransomware can damage client trust and company reputation.

Support risk
Future IT staff need clear documentation to manage issues consistently and quickly.

Funding solves this by creating structure before risk becomes expensive.

Why IT Infrastructure Matters

A business investment that supports productivity, trust and scalable operations

Every department depends on technology

- Finance: protects financial records
- HR: protects employee information
- Sales: needs reliable communication
- Development: needs stable tools
- Management: needs secure reporting

Business case

A strong IT foundation reduces disruption, protects data, improves collaboration and lets the business add users, devices and services without redesigning everything from scratch.

Funding Use: Infrastructure Investment

What the funding will enable for Ubuntu Innovations' new office setup

Employee devices	20 desktops + 5 laptops Supports daily operations and mobility
Network equipment	Router/firewall, managed switch, Wi-Fi APs Reliable wired and wireless connectivity
Shared services	NAS storage, printers, UPS units File sharing, backups and power protection
Security & software	Endpoint protection, updates, backups Protects systems and supports compliance

Secure Network Design

A manageable architecture that supports reliable connectivity and future expansion

Investor value

The network is structured, easier to troubleshoot and designed to add more users or devices without rebuilding the environment.

Data Protection and Access Control

Department-based permissions reduce internal risk and support responsible governance

Department	Security group	Access level
Management	mgmt_grp	Full access
Finance	finance_grp	Finance only
HR	hr_grp	HR only
Sales	sales_grp	Sales only
Development	dev_grp	Development only

Least privilege

Users only receive the access required for their role.

Sensitive data

Finance, HR and management records remain restricted.

Governance

Group-based access is easier to audit and maintain.

Backup, Recovery and Business Continuity

A layered recovery plan reduces downtime and protects business data

RTO

Defines how quickly systems should be restored after an incident.

RPO

Defines how much data loss the company can tolerate.

Testing

Backups must be tested regularly to confirm they can be restored.

Cybersecurity and Risk Reduction

Protecting client trust, company reputation and future revenue

Core controls

MFA, strong passwords, antivirus, device encryption, patch management and acceptable use policies.

People controls

Security awareness training reduces phishing, password reuse and unsafe browsing behaviour.

Response controls

Incident response follows detection, reporting, containment, eradication, recovery and lessons learned.

Top risks and mitigation

Risk	Likelihood	Impact	Mitigation
Phishing	High	High	Training + MFA
Ransomware	Medium	High	Backups + EDR
Hardware failure	Medium	Medium	Redundancy
Power outage	Medium	High	UPS devices

Funding Request and Expected Impact

The ask: fund the secure infrastructure needed for sustainable growth.

Reduced downtime

More reliable daily operations

Improved productivity

Employees have the right tools

Stronger security

Sensitive data is protected

Scalable growth

Infrastructure can expand with the business

Investor confidence

Clear plan, controlled risk and continuity

Why invest now?

- New office setup creates the right implementation window
- Early investment prevents costly reactive fixes
- Security and continuity protect long-term value
- The solution is practical for 25 employees and scalable

Ubuntu Innovations is preparing for growth responsibly.

Thank you
