

# Task 4 – Software Deployment Plan

Tech Career Accelerator Week 2  
Deliverable

## 1. Purpose and Scope

This document outlines the approach for deploying, maintaining, and licensing software across the Tech Career Accelerator environment. It covers the standard software baseline applied to all devices, department-specific applications, the update lifecycle, and licence management obligations. All deployments must be approved by the IT Manager prior to installation on any production endpoint.

## 2. Standard Software Packages

The following packages form the approved baseline installed on every company-managed device, regardless of department:

| Package              | Version Policy | Purpose                                      |
|----------------------|----------------|----------------------------------------------|
| Ubuntu LTS (OS)      | Latest LTS     | Operating system foundation                  |
| LibreOffice          | Latest stable  | Word processing, spreadsheets, presentations |
| Mozilla Firefox      | Latest ESR     | Approved web browser                         |
| Remmina / VPN Client | Latest stable  | Remote access and secure tunnelling          |
| ClamAV + GUI         | Latest stable  | Endpoint antivirus protection                |
| CUPS Print Services  | Distro default | Printing and scanner integration             |
| OpenSSH Client       | Distro default | Secure shell access to servers               |
| Timeshift            | Latest stable  | System snapshot and recovery                 |

Table 1 – Standard software baseline for all endpoints.

## 3. Department-Specific Software

| Department | Application            | Purpose                                 |
|------------|------------------------|-----------------------------------------|
| Finance    | GnuCash / Sage (cloud) | Accounting and financial management     |
| Finance    | PDF Studio             | Invoice generation and document signing |
| HR         | OrangeHRM (web app)    | Employee records and leave management   |
| HR         | Zoom / MS Teams        | Video interviewing and onboarding       |
| Sales      | CRM – Odoo (web app)   | Customer relationship management        |

| Department  | Application             | Purpose                                   |
|-------------|-------------------------|-------------------------------------------|
| Sales       | Canva (web app)         | Marketing material creation               |
| Development | VS Code                 | Primary code editor                       |
| Development | Docker + Docker Compose | Containerised development environments    |
| Development | Git + GitHub CLI        | Version control and repository management |
| Development | Postman                 | API development and testing               |
| Management  | Metabase (web app)      | Business intelligence and reporting       |
| Management  | Zoom / MS Teams         | Executive communication and conferencing  |

Table 2 – Department-specific software allocations.

## 4. Update Procedures

### Weekly – Security Patches

The IT team runs unattended-upgrades on all servers every Sunday at 02:00 SAST. Workstations receive security patches via a managed APT mirror. Critical patches are applied within 48 hours of release regardless of schedule.

### Monthly – Feature Updates

Non-security updates are batched and deployed on the first Tuesday of each month following a staged rollout: Development devices receive updates first, followed by a 48-hour observation window before wider deployment.

### Ad Hoc – Emergency Patches

Zero-day or actively exploited vulnerabilities trigger an immediate change request. The IT Manager approves an emergency maintenance window and communicates impact to affected departments before deployment.

### Post-Update Verification

Following every patch cycle, a post-deployment checklist is completed confirming that critical services are running, user logins are functional, and no regressions have been introduced.

## 5. Licensing Requirements

All software deployed within the environment must be covered by an appropriate licence. The following obligations apply:

- A software asset register must be maintained and reviewed quarterly by the IT Manager.
- Open-source software must be verified for licence compatibility before use in any commercial workflow.
- Subscription-based licences (e.g., SaaS tools) must be renewed at least 30 days before expiry.
- Per-seat licences may not exceed the number of assigned users; over-provisioning requires prior approval.
- Any unlicensed or unapproved software discovered on company devices will be removed without notice.
- Licence keys and activation credentials must be stored in the IT team's password manager, not in plain text.
